

ExtractColumnNames Documentation

Module name: Extract ColumnNames

Description: Lists the sample descriptors from a .res file.

Author: Justin Lamb (Broad Institute), gp-help@broad.mit.edu

Date: 4/14/03 **Release:** 1.0

Summary: This task reads the sample descriptors (*ie* column headers) from a .res file and produces a numbered listing of these. The numbers assigned to samples by this utility are used to specify 'column slices' in the *SelectFeaturesColumns* tool.

Parameters:

Name Description

output name of the output file (a .txt extension will be appended) input filename the .res file from which sample descriptors are to be extracted

Return Value:

output.txt: a text file containing a numbered list of sample descriptors

Platform dependencies:

Task type: GeneListSelection

CPU type: any
OS: any
Java JVM level: n/a
Language: Perl
Support files: none

Release Information

Renamed from ExtractFeatureListColumns
